

# Semantic Service Oriented Architecture

## *The SSOA Program*

A Semantically Powered Architecture to  
Enable Inter-Agency Capabilities Sharing

February 23, 2006

# Public Recognition

Federal CIO Council's Semantic Interoperability Community of Practice (SICoP)

## *Special Recognition*

**Elisa Kendall, Sandpiper, Sam Chance, US Navy,  
& Michael Seebold, Concurrent Technologies Corporation**

**For the "Best Co-Papers"  
"Standards for Model-Driven Semantics" &  
"Semantic Service Oriented Architecture" for the  
Fourth Semantic Interoperability for E-Government  
Conference, February 9-10, 2006**

**By SICoP Chair, Brand Niemann, U.S. EPA**

*Produced in Collaboration With*

**SICoP**

**MITRE**

# SSOA Problem Domain

## Analysts Lack Awareness of Available Capabilities (Services)

- ◆ Sheer Volumes of Data and Services Compounds the Problem
  - Word of Mouth Awareness Typical
- ◆ Available [XML] Web Services Solutions are Pervasive, but...
  - Lack Ability to Easily Discover Services
  - Are Location Dependent; "Stale" References Possible
  - Have Weak, or No, Semantics
  - Include Ever-growing Multitude of Largely Unimplemented Standards (re: WS-\*)
- ◆ When Found, Services Typically Not Easy to Use, Not Interoperable
  - Services are Not Described by "What They Provide"
  - Machine Interpretable Standards Immature, Not Implemented
  - Resulting Processes are Human-Centric, Ad-hoc and Intermittently Repeated
- ◆ Resulting in Fragmented, Sub-Optimal Analysis
  - Long Standing Problem – Analysts Aren't Able to Focus on Analysis

# SSOA Provides Significant Value

SSOA Compliments XML Web Services by Supporting a SOA that is:

◆ **Semantically Enabled**

- Powering Efficient Publishing, Discovery, and Execution of all Available Services
- Recommending Interesting Services to End Users when New Services Come Online
- Allowing Software Agents to Dynamically Construct Workflows and Substitute Services upon Failure
- Designed and Implemented Based on Current and Emerging Semantic Web Standards
- Providing the Ability to Compose Virtual Applications Based on Defined Semantic Attributes

◆ **Powered By an Extended *Jini*<sup>TM</sup> Based Platform from Valaran**

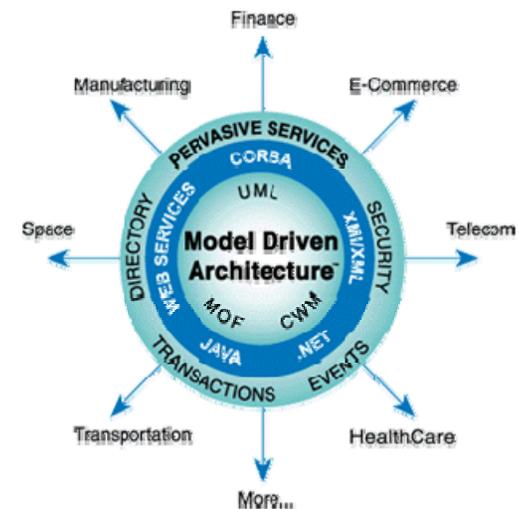

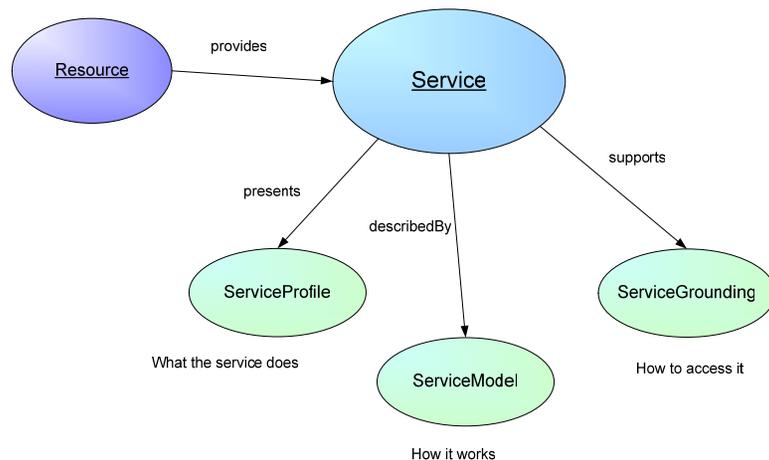

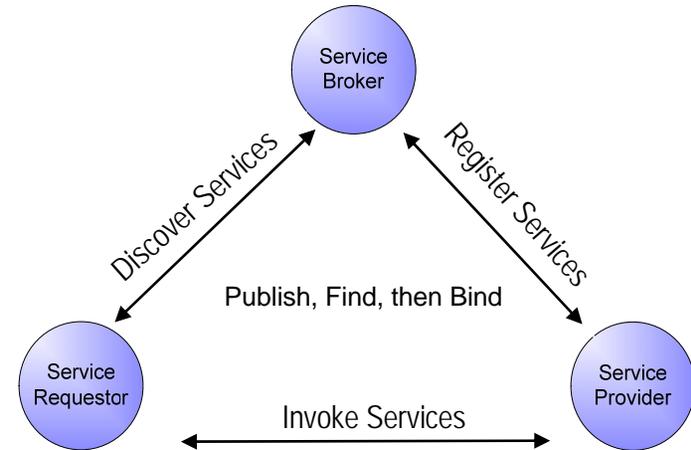

- Flexible Location Independent Services, Spontaneous Networking & Services Interchange
- Providing Self Healing from Network Failures
- Allowing Near-Real Time Collaboration and Capabilities Sharing
- Proactive System Health Monitoring of All Services
- Grounded on a Proven Enterprise-Scale Distributed Computing Model

◆ **Demonstrating the Ability to Share Resources Across Disparate Organizations**

- Enhancing Current SOA Projects by Acting as Risk Reduction/Complimentary Task

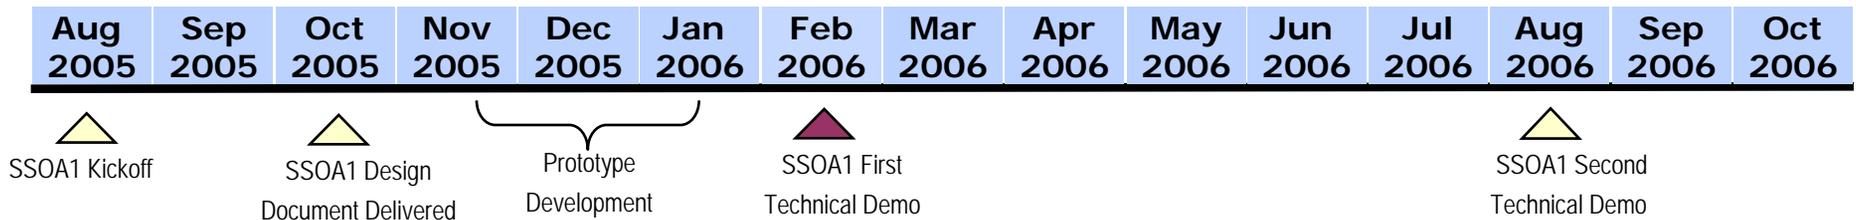

# SSOA Technical Foundations

- Service Oriented Architecture (SOA)
- Semantics Based Computing
- Standards Based Design (SBD)
  - ◆ *ISO 11179 Metadata Registries Standard*
  - ◆ *ISO 19763 Meta-Model Framework Standard*
  - ◆ *ISO 24707 Common Logic Standard*
  - ◆ *OMG Ontology Definition Meta-Model Standard*
  - ◆ *W3C Semantic Web Services Framework*

# SSOA1 Project Timeline & Team

## SSOA1 Project Timeline

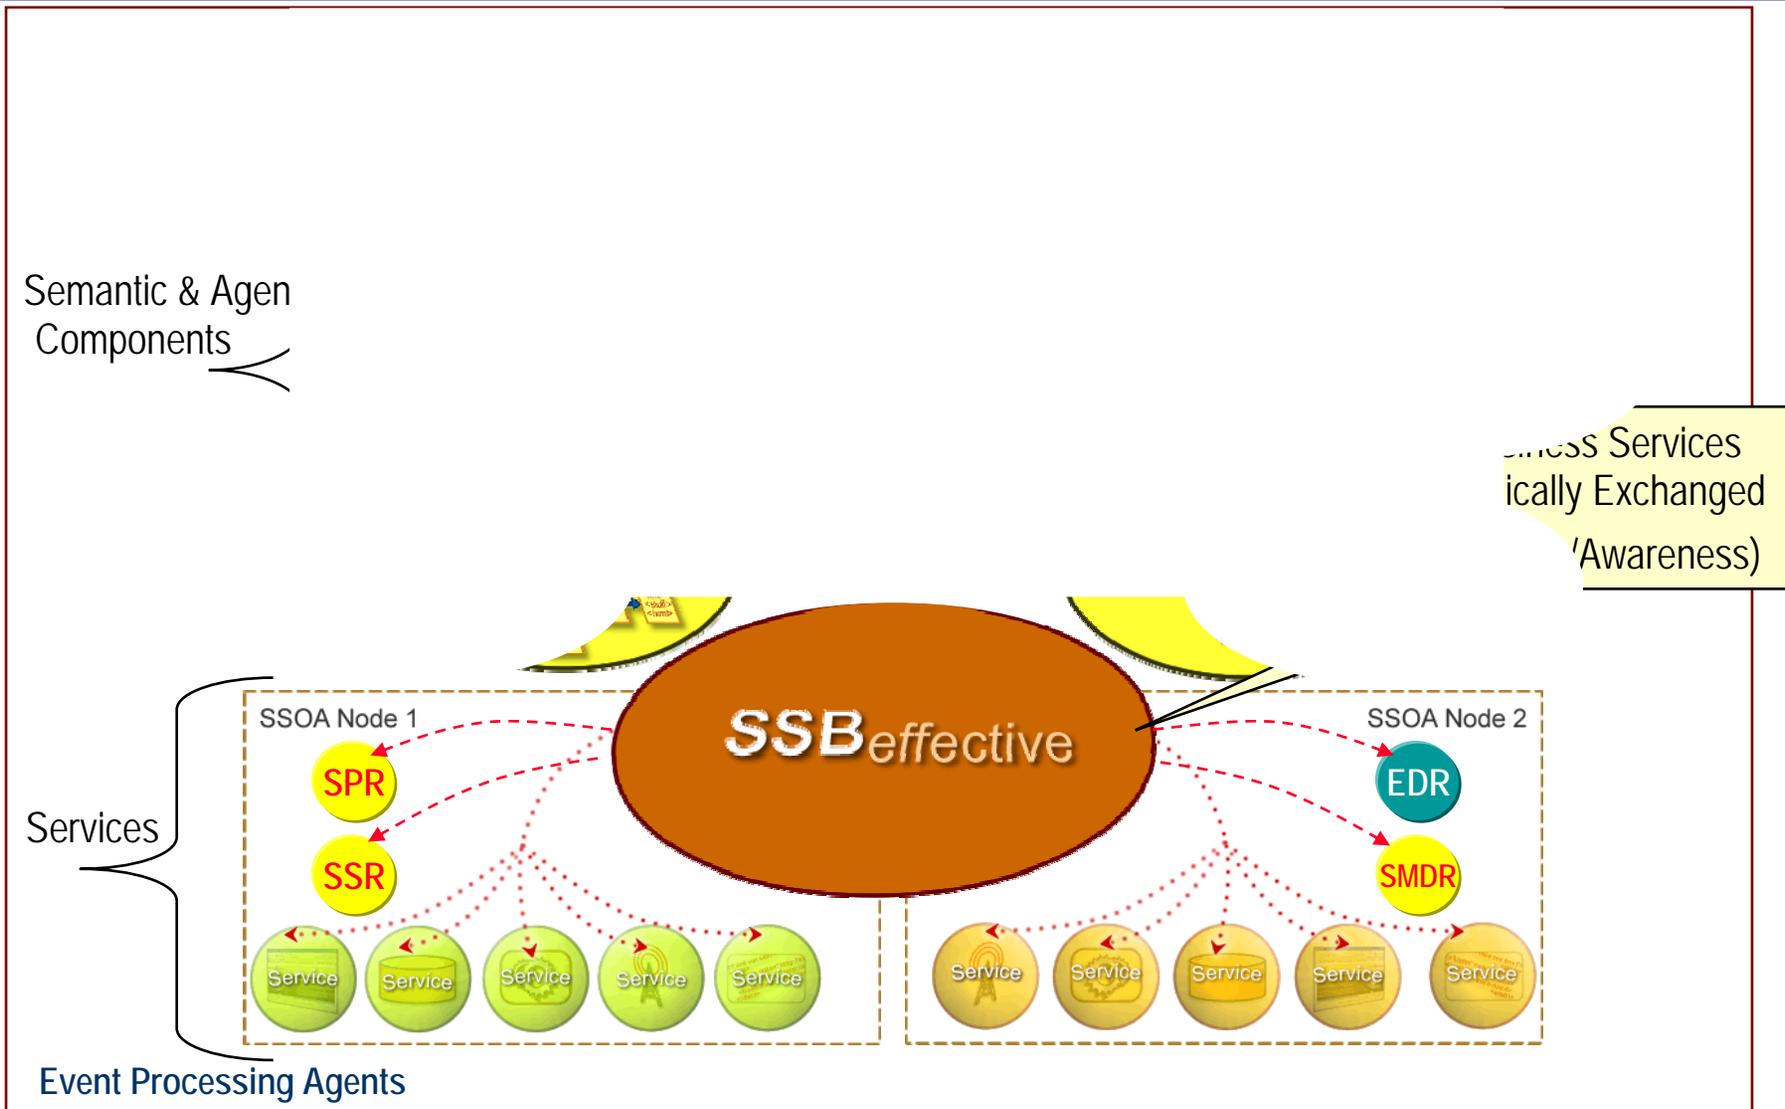

- **SSOA1 Development Team**

- ◆ CTC is Prime Contractor

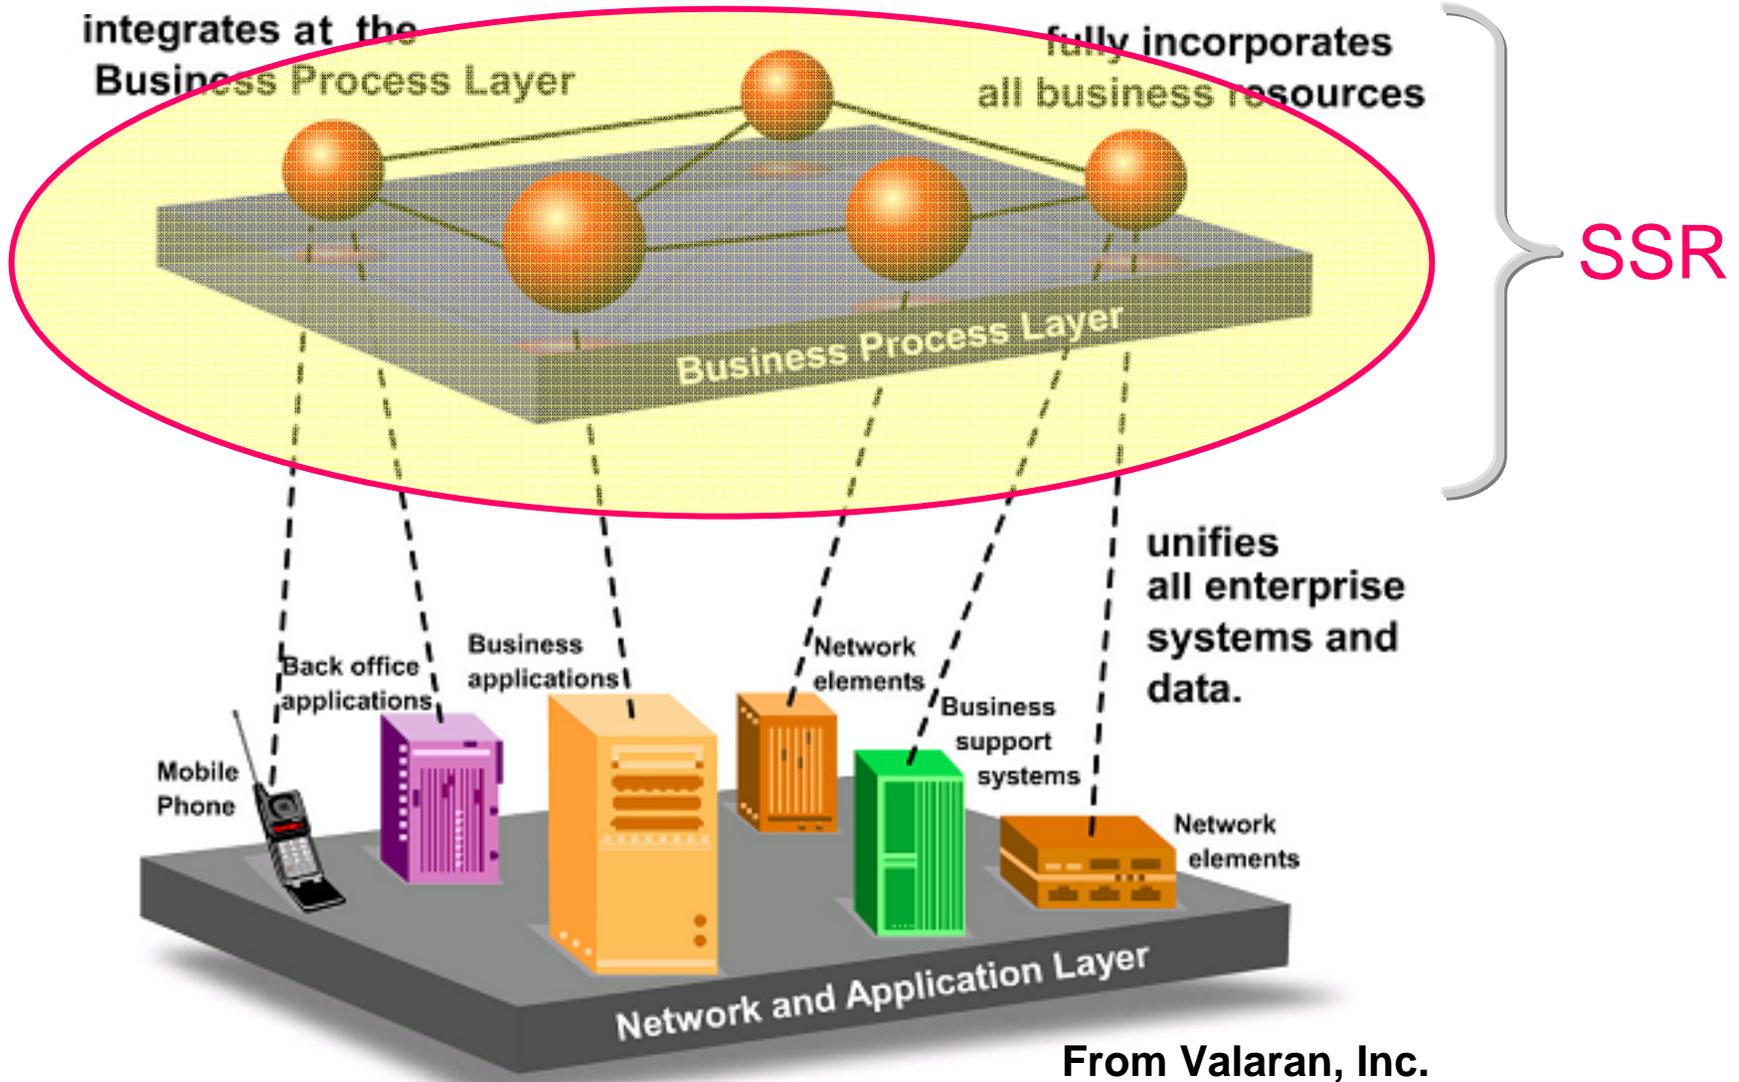

- ◆ Acquire & Integrate COTS Components:

- **Ontology Works** – Provides Common Logic (CL) based Ontology Services for Semantic Integration of Data and Services Across Distributed and Heterogeneous Enterprise Resources
- **Valaran Corporation** – Provides a Jini™-based Platform for Developing Service Oriented Architectures (SOA) for Integrating and Managing Distributed and/or Fluid Applications.
- **Agent Logic** – Provides Enterprise Agent Server™ Technology – a Server-based Event Detection and Response Platform that Detects and Responds to Events Across Disparate Sources

# SSOA System View

# Powerful Jini-Based Abstraction

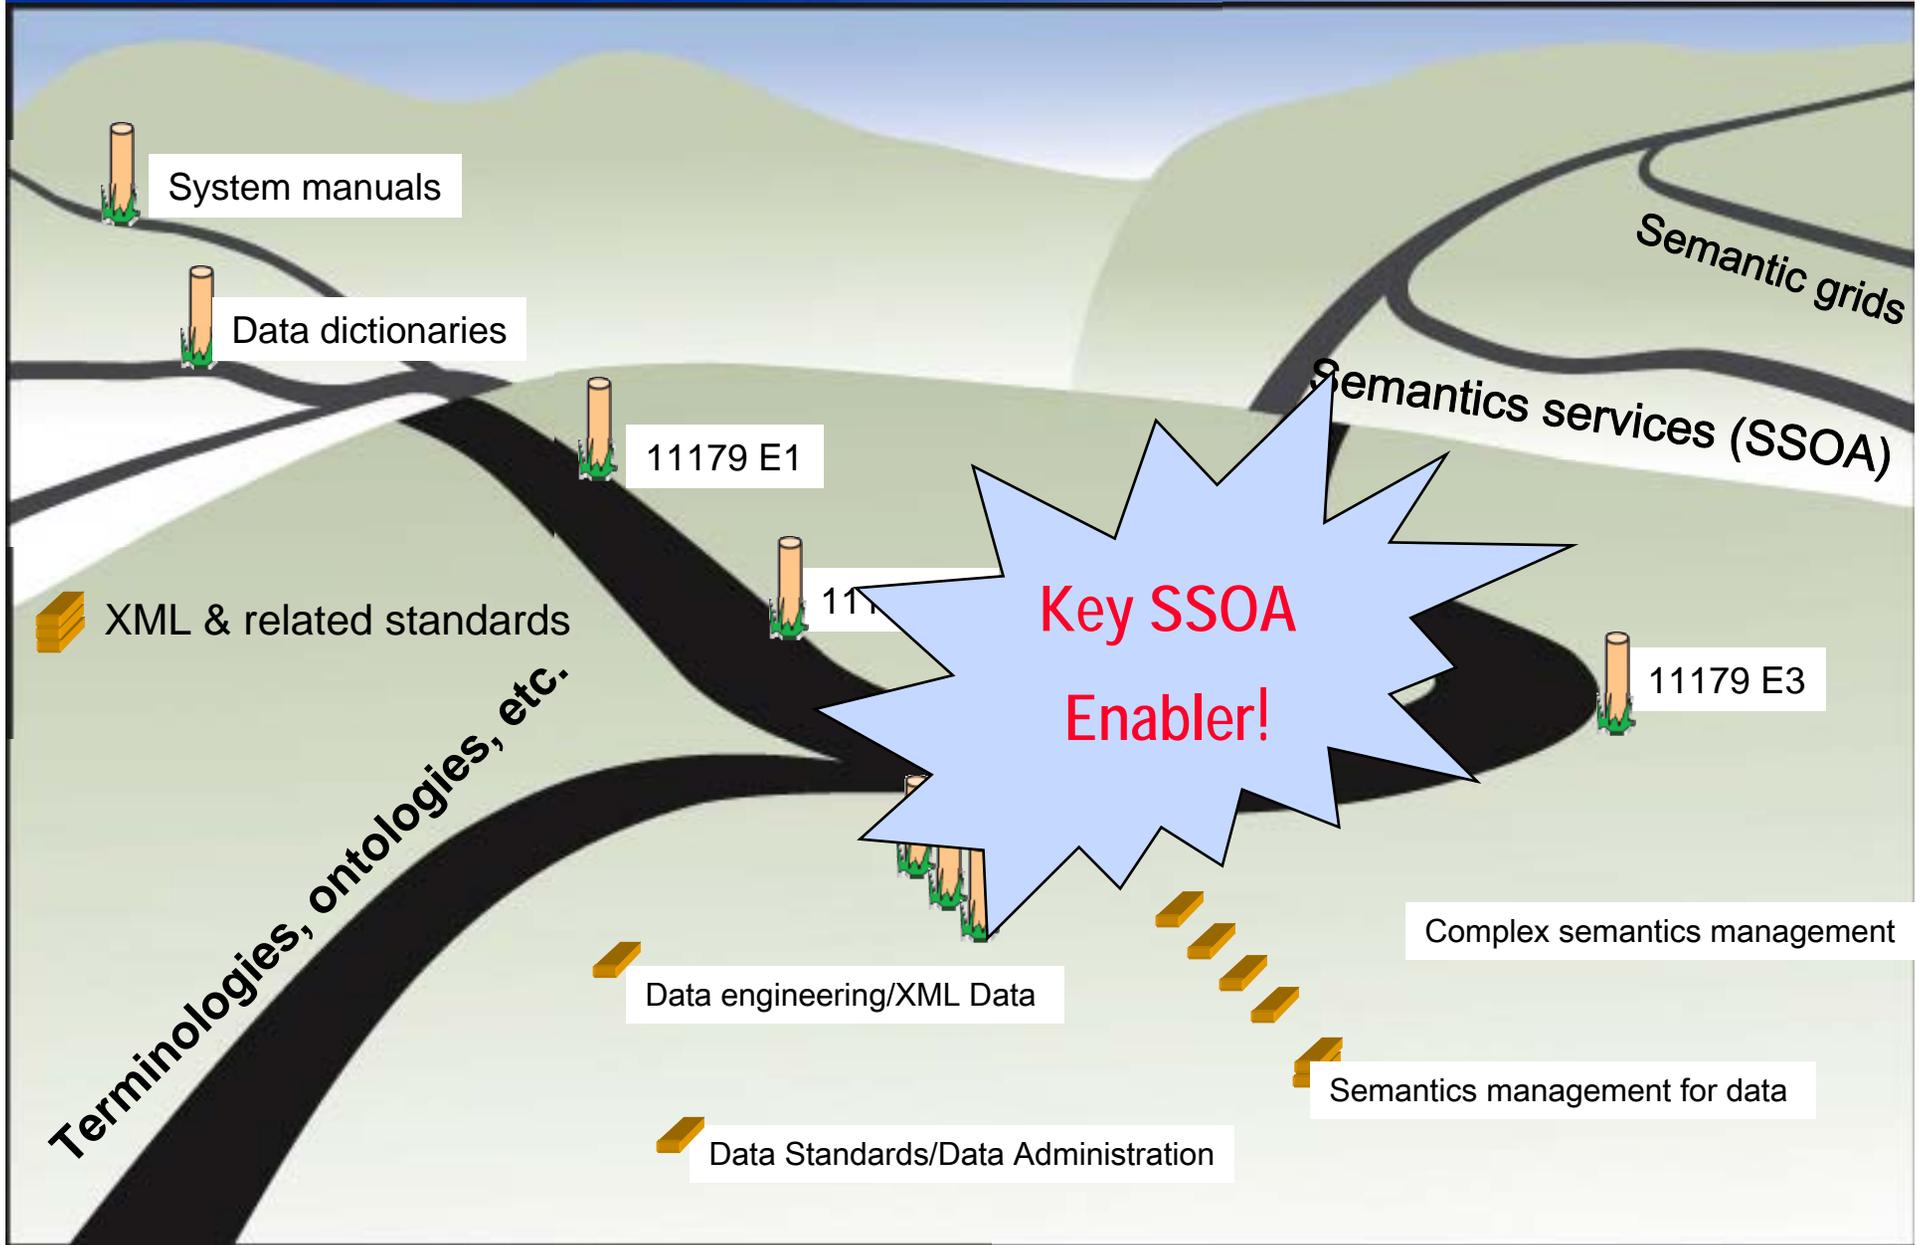

# XMDR Project Is Key Enabler

- Multi-Agency, Collaborative Project
- Extend Semantics Management Capabilities of ISO/IEC 11179
- Cross-Domain, Various Structures
- Test & Demo Extended Capabilities of Reference Implementation (RI)
- Produce Design for Operational 11179 Registries
- Adapt & Adopt Emerging (Semantic) Technologies
- Propose Revisions to 11179 Parts 2 & 3 (Ver. 3)
- Help Resolve Registration & *Interrelation* Issues for Complex Metadata Standards

[www.xmdr.org](http://www.xmdr.org)

# Where have we been? Where are we now?...& where are we planning to go?

# What is XMDR?

## eXtended MetaData Registries

- A Set of *Collaborative Initiatives* by Groups With Shared Goals
  - ◆ Extend the ISO/IEC 11179 Metadata Registry Standard (XMDR-S)
    - EPA, NCI, DOD, LBNL, Mayo Clinic, USGS, Ecoterm, UNEP, GBIF
  - ◆ Align & Harmonize Various Related Metadata Standards (XMDR-H)
    - ISO WG2: 11179, 19763, 20944, 24707; OMG: ODM, CWM;
    - Say Which Is Which
    - (Several of the Above Groups Have Members on These Committees)
- An Open Source *Implementation & Testbed* (XMDR-IT) To
  - ◆ Assemble & Test Metadata From Diverse Sources & Structures
    - E.G., Terminologies, Ontologies, Etc. For Health, Environment, Geography, ...
  - ◆ Explore Emerging Semantic Technologies (E.G., RDF, OWL, CL, ...)
  - ◆ Demonstrate New Capabilities
    - E.G., Ontology Lifecycle Management & Harmonization

# Why Do We Need Metadata Registry Extensions? ...In Order To

- **Enhance Capabilities** to Capture, Retrieve *Semantics* of Information Artifacts
  - ◆ Data Elements, Value Domains) in Metadata Registries Using Terminologies, Taxonomies, Ontologies, Etc.
- **Improve Representation of Relationships** Between Data and Concept Structures
  - ◆ Objects, Data Elements & Domains
  - ◆ Ontologies, Taxonomies, Thesauri, Terminologies, ...
- **Register Complex Semantic Metadata** (Concept Structures, Terminologies) in More Formal, Systematic Ways
  - ◆ (e.g., Description Logic) to Facilitate Machine Processing for...
    - Creating and Managing Names, Definitions, Terms, Etc.
    - Linking Together Data Elements, Etc. Across Multiple Systems
    - Discovering Relationships Among Data Elements & Terms

# XMDR Semantic Extensions Goals

- Sharable Data That Can Easily be Identified And Aggregated Across Organizations
  - ◆ Unambiguous Metadata Characteristics To Convey Semantic, Syntactic And Lexical Meaning
    - Human AND Machine Understandable
- Registration And Management of Everything Useful for Administering And Managing Data, Including Concept Systems, Ontologies, Etc.
- Machine Understanding of Semantics to Facilitate Inference, Aggregation, And Agent Services

# XMDR Prototype bridges different realms of metadata standards

## Information Artifacts

**OMG Standards:**  
MOF, UML, CWM  
*schemas, models, ...*

## Conceptual Models (of the “real world”)

**Terminology Standards**  
ISO 1082,  
thesauri, ...

### XMDR Prototype

#### 11179 ed. 3 Metadata Registry Standards

- Data Elements
- Value Domains
  - e.g, enumerated
- .....

- Data Element Concepts
- Conceptual Domains
- Concepts
- Ontologies
- .....

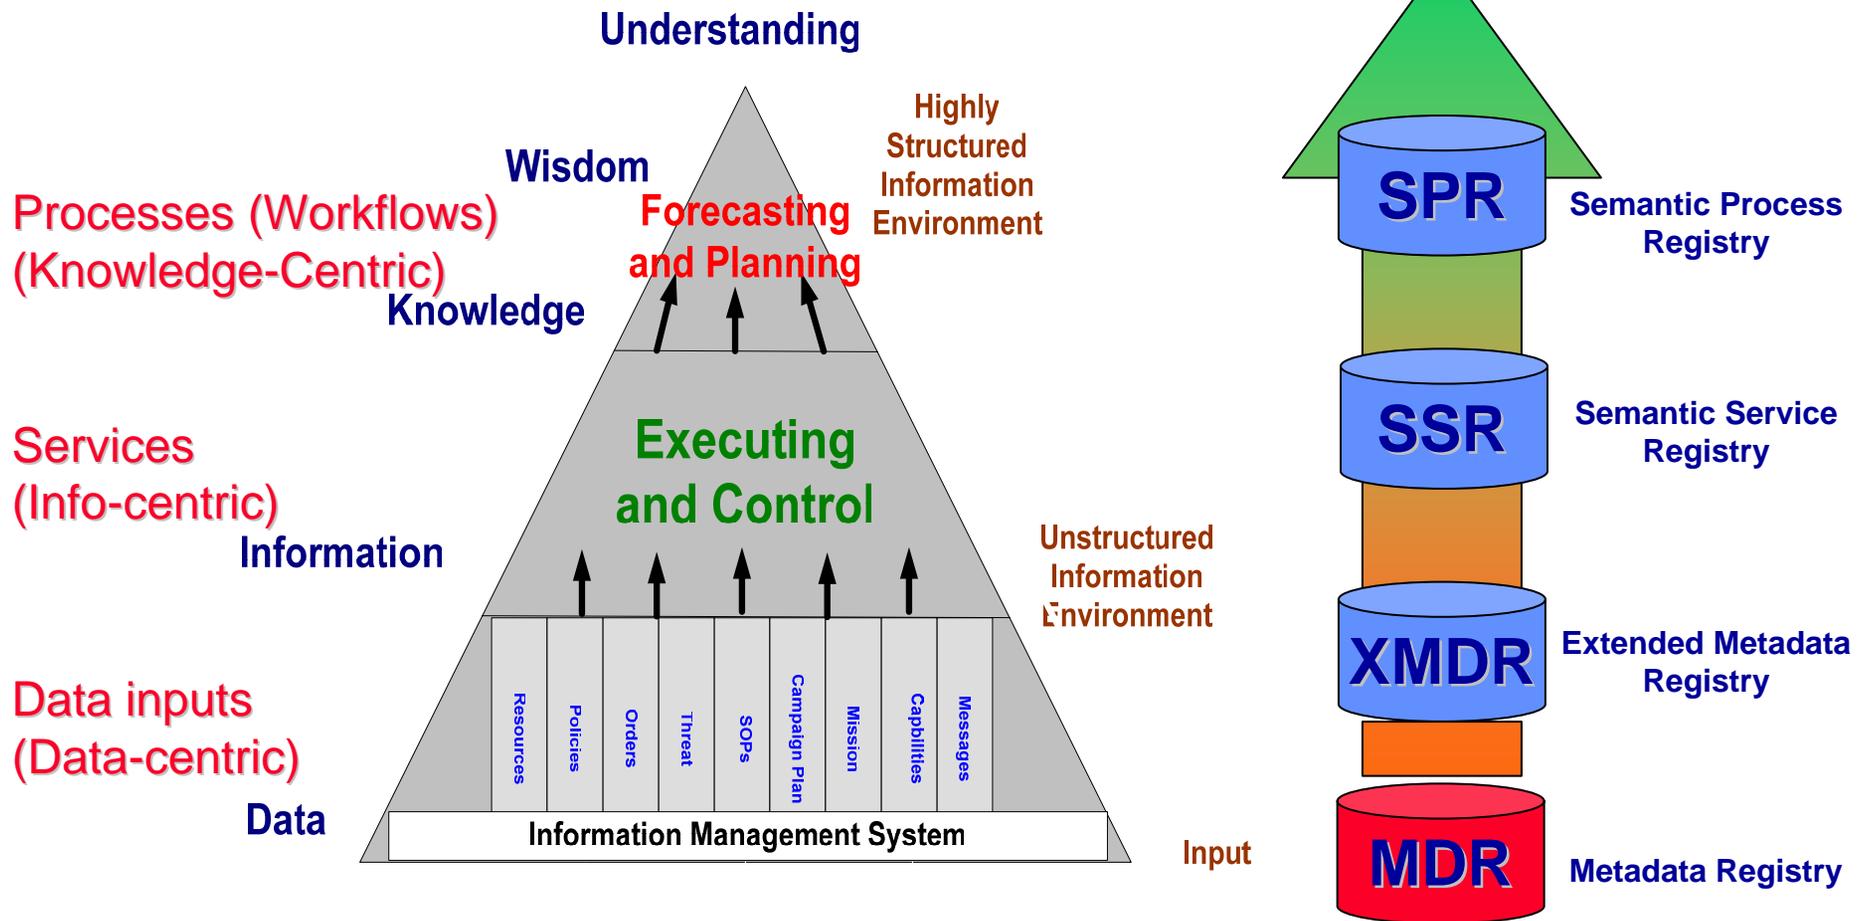

**Ontology Standards:**  
OWL, KIF,  
CL, XTM,  
....

*Incorporating more structured and formal semantic components to facilitate data integration, harmonization & information discovery*

# XMDR Prototype Available

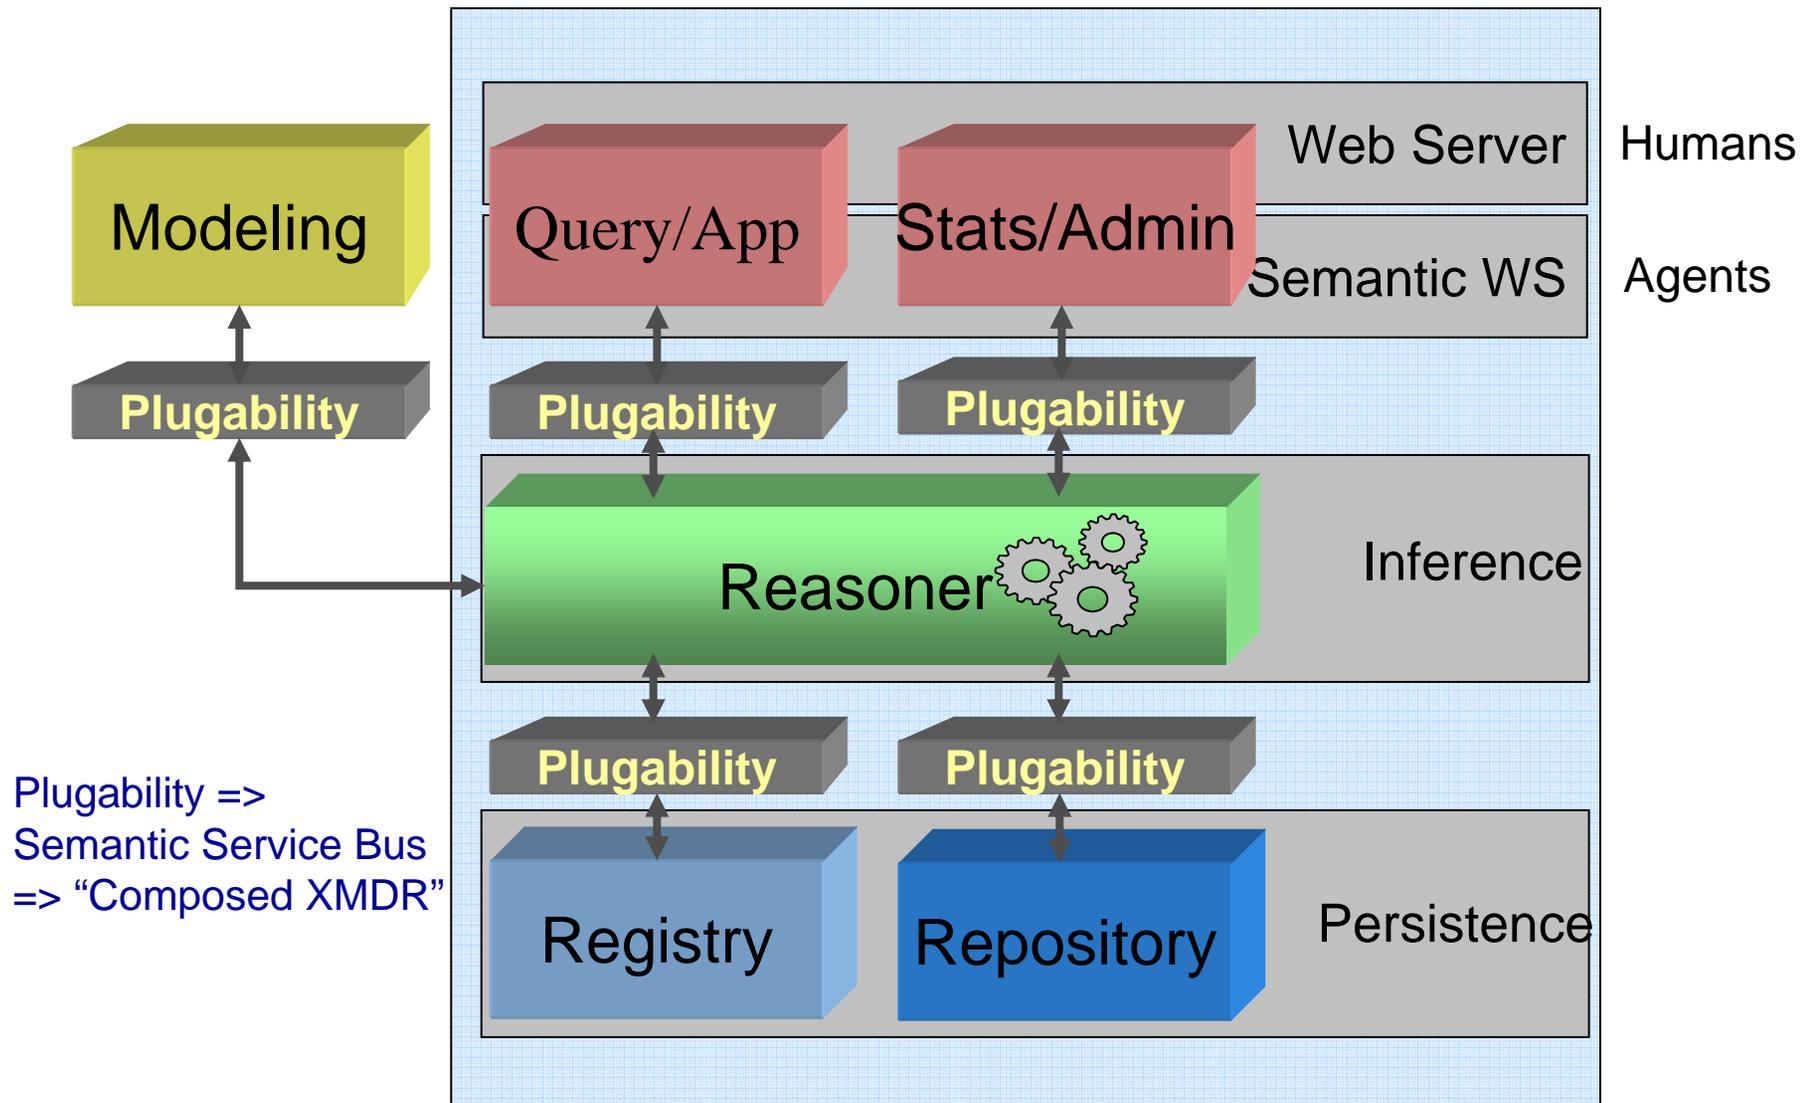

- XMDR Site
  - ◆ <http://www.xmdr.org>
- Prototype
  - ◆ <http://xmdr.lbl.gov/xmdr/>
- Complete set of current test queries are at
  - ◆ <http://del.icio.us/kberket/xmdr>

# The Meta-\* Factor

(Chorfas, 2002)

# Virtual XMDR App from Re-usable Services

# Conclusions
